

### The Future is Ours to See

#### *United States and the beyond*

1. Most scientists agree that lowering carbon emissions is essential but they disagree on whether 100% renewable energy is the way forward.
2. The federal government has vowed to make significant monetary commitments to the issue of green energy but standards to obtaining the money have not yet been established in many issues.
3. Much of the technology needed to reach our carbon emissions goals is in its fledgling stages.
4. Infrastructure build out required to achieve net zero emissions faces significant obstacles, some from the “not my back yard” mentality (wind and solar power)
5. Legal opportunities abound with the green movement, from land use issues to greenwashing to challenges to agency rule making.
